

Saturday Night Platinum-Palladium Discovery

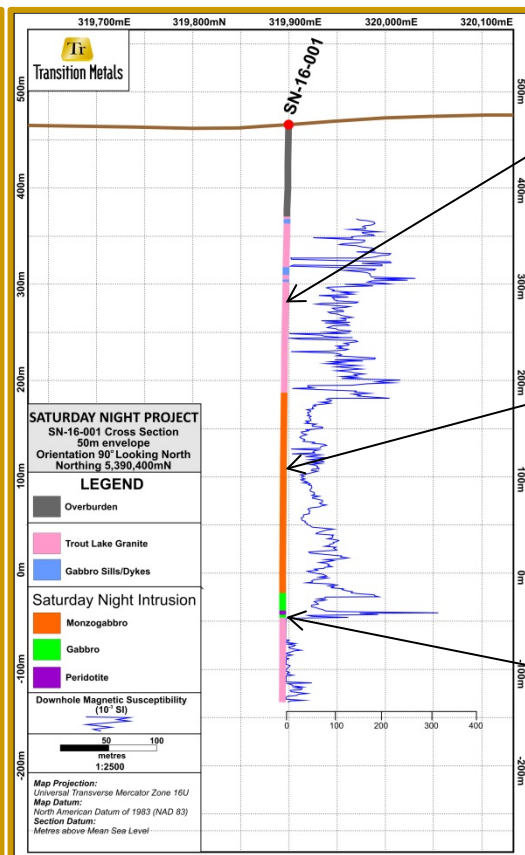

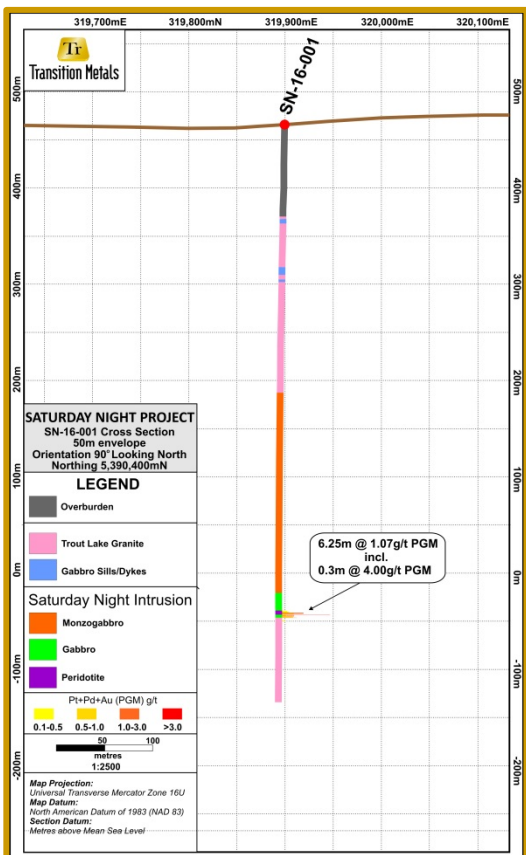

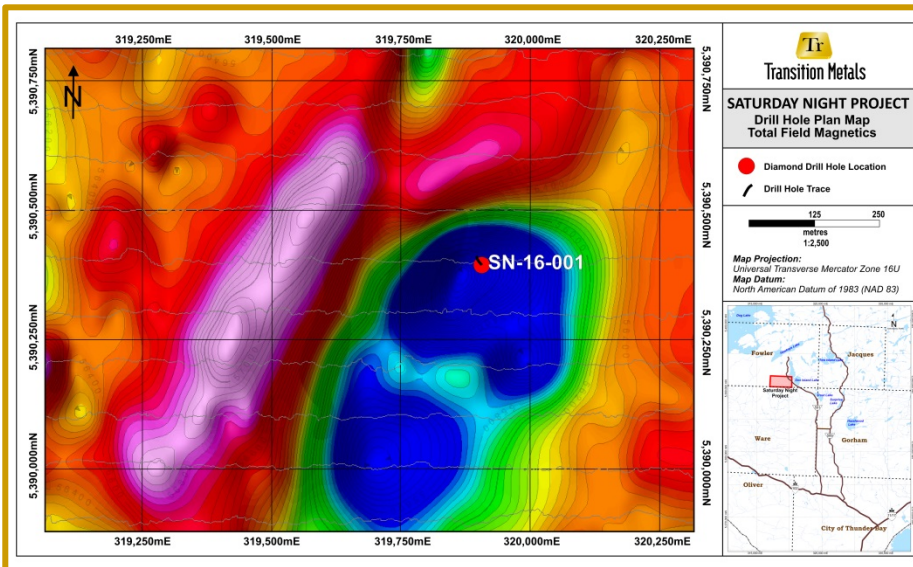

- PGM-Cu-Ni project is located 25km north of the city of Thunder Bay, Ontario and 60km south of North American Palladium's Lac Des Iles mine
- Defined by a strong, prominent circular remnant magnetic anomaly, similar to anomalies associated with the Sunday Lake and Thunder Bay North Intrusions.
- A single drill hole, SN-16-001, tested a portion of the magnetic anomaly and intersected a mafic-ultramafic layered intrusion over a core length of 225.25m. Near the base of the intrusion elevated PGM-Cu-Ni mineralization associated with disseminated and blebby sulfides returned values of **1.07g/t PGM's over 6.25m from 507m** including a higher grade section of **4.0 g/t PGM, 0.56% Cu over a core length of 0.30 metres from 509.78m.**

Midcontinent Rift Area

Geology

- Hosted within Midcontinent Rift related intrusive rocks similar to the other Ni-Cu-PGM deposits (TBN, Eagle, Tamarack, Sunday Lake)
- Prominent remnant magnetic anomaly has a diameter of 800m and has been tested by a single diamond drill hole
- Intense brecciation and alteration of overlying country rocks is comparable in scale to that observed at the Sunday Lake Intrusion

Altered granite country rocks

Monzogabbro

Chalcopyrite in mineralized melagabbro
